Prompt-1

https://github.com/ananya051281/14_2048

I am working on a Python-based 2048 game. Please inspect the provided project files and identify the intentional merge bug in the existing implementation.

For Task 1, fix only the merge logic. In standard 2048, a tile created by a merge must not merge again during the same move. For example, [2, 2, 2, 2] moving left must result in [4, 4, 0, 0], not [8, 0, 0, 0].

Preserve the existing project structure, movement functions, and other functionality. Do not add dependencies or rewrite unrelated code.

Prompt-2

Task 1 has been successfully applied, tested, committed, and pushed to my fork. Please proceed to Task 2 only. Inspect the current repository state and the Task 2 requirements from the README. Identify the required changes for game-state handling, explain which files/functions need modification, and provide the minimal code changes. Also provide specific test cases with expected results. Do not implement Task 3 or Task 4 yet, and preserve the Task 1 merge fix.

Prompt-3

Task 2 has been applied, all specified tests passed, and the changes have been committed and pushed. Please proceed to Task 3 only.

Prompt-4

Task 3 has been fully implemented according to the README requirements. I tested the undo functionality, score restoration, one-level undo behavior, and the Task 1 regression test; all specified tests passed. The changes have

been committed and pushed to my fork. Please inspect the current repository state and proceed with Task 4 only. First identify the Task 4 requirements, the files/functions that need modification, and the minimal code changes required. Do not make or suggest changes for later tasks.

Prompt-5

All the tests worked, what do I do next?
